

Introduction to Fitting Paragon CRT & CRT Dual Axis *Certification Training*

Leah Johnson, OD, FAAO

*Director, Global Professional Services, Paragon Vision Sciences
Clinical Adjunct Professor, University of Houston*

US FDA Approval – 2002

First to receive FDA market approval for orthokeratology overnight wear – June 2002

Approval includes myopia correction:

- up to $-6.00D$
- with or without astigmatism
- up to $-1.75D$ of astigmatism
- **NO AGE RESTRICTIONS**

This is the **highest** range of approval for any ortho-k lens

How Does OrthoK work?

Hydraulic Forces in Closed Eyelid Environment

- Positive (Push) Force applied to BC
- Negative (Pull) Force in the Return Zone

Normal Human Cornea

<u>Layer</u>	<u>Average Thickness of Central Cornea</u>
Epithelium	50 Microns
Bowmans Layer	10 Microns
Stroma	465 Microns
Descemets Membrane	10 Microns
Endothelium	5 Microns

Approximate Total Thickness
540 Microns (.54 mm)

Compression versus Redistribution

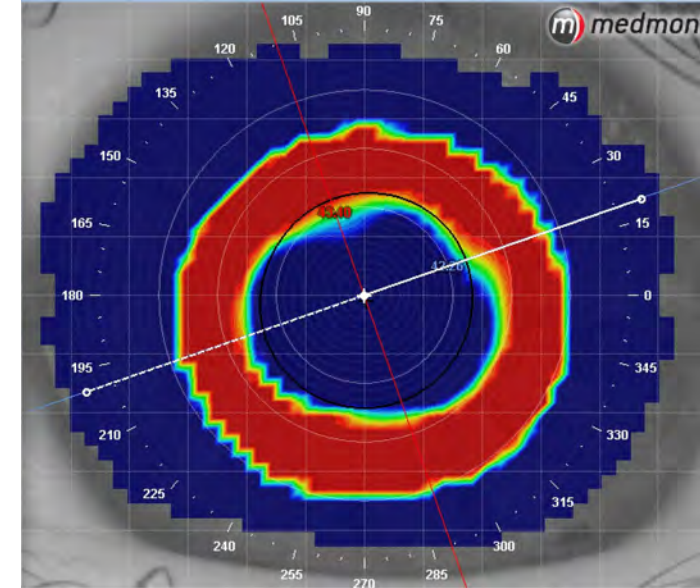

Redistribution of Cellular Fluid

How Does OrthoK work?

Forces work together in a semi-closed environment to allow for appropriate epithelial changes

RETURN ZONE 1MM (FIXED)

OPTIC ZONE 6 MM (FIXED)

LANDING ZONE (NOT FIXED)
BASED ON DIAMETER SIZE

1. Base Curve (BC) – millimeters (ex: 8.9mm)
2. Return Zone Depth (RZD) - sagittal depth, microns (ex: 550um)
3. Landing Zone Angle (LZA) – degrees (ex: -33°)

Base Curve (Treatment Curve) Selection

- Provides the mold for the treatment
- Measured in mm of radius (ex: 8.9mm)
- Calculated from the Initial Lens Selector (slide rule or electronic format)
- Jessen Factor set at +0.50 in all lenses for regression

Calculating BC Selection

- Jessen Factor set at +0.50D in all lenses for regression, fit 0.50D flatter than K
- Patient Manifest Rx: -3.00 Target Rx: $-3.00 - 0.50 = -3.50$
- Patient K Values: 42.00/42.40

BC Selection: $42.00 - 3.50 = 38.5$ (8.76 → 8.8)

Base Curve (Treatment Curve) Selection

- The Base Curve is *never* adjusted to change the fit.
- When to change the Base Curve?
- CHECK REFRACTION OVER LENS (ROL) to ensure BC is accurate
- Typically, ROL should be plano to +0.50
- The corneal shape does not fully conform to the back surface of the lens
- Young adults, +0.50 to +1.00
- Pre-presbyopes, plano

Return Zone Depth (RZD)

Measured in Sagittal depth (um)
25um increments

DEEPER

600 um

575 um

550 um

525 um

500 um

SHALLOWER

Return Zone Depth (RZD)

When to change Return Zone Depth?

Centration!

Return Zone Depth (RZD) – Too Flat

Sagittal Depth Changes (changes in 25um steps)

500 RZD

525 RZD

Precise Control of Applied Treatment
through Proximity Control Technology™

Return Zone Depth (RZD) – Too High

Sagittal Depth Changes (changes in 25um steps)

600 RZD

550 RZD

Precise Control of Applied Treatment
through Proximity Control Technology™

Return Zone Depth (RZD)

Spherical CRT on eye with corneal cylinder and enough elevation difference = incomplete peripheral alignment

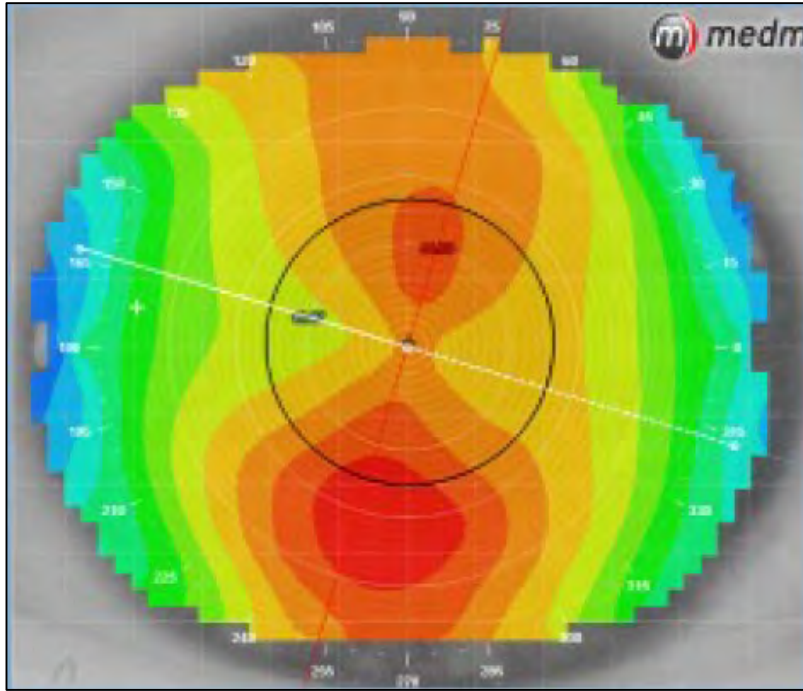

550/600
RZD1/
RZD2

Paragon CRT Dual Axis Design

Dual Axis Candidates

Corneal Toricity
 $\geq 0.75D$

Incomplete Treatment or
“Bull’s Eye” Pattern

Stubborn Decentered
CRT Lens

Using Corneal Cylinder to help determine initial Dual Axis depth difference

Fitting Guide

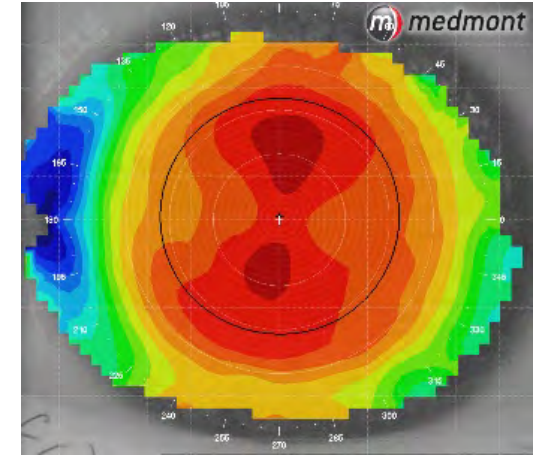

*just a guide to start - may still need to adjust/increase RZD difference based on NaFl pattern of lens and topography

0.75D – 1.50D of cyl ~ 50 μ m RZD1/2

1.50D – 1.75D of cyl ~ 75 μ m RZD1/2

Customize RZD₁/RZD₂ in 25 μ m steps,

Lens has been made up to 175 μ m difference in dual depth

"Safe" Landing Zone Angle (LZA)

Landing Zone can *only* be tangent to the underlying corneal surface

Landing Zone Angle (LZA)

Angle (degrees)

1° increment

Higher degree number (34°)
= Steeper

- 1° increase = increase sagittal depth (+15um)

Lower degree number (31°)
= Flatter

- 1° decrease = decrease sagittal depth (-15um)

Controls:

- Edge lift
- Overall sagittal depth

Landing Zone Angle (Too flat)

Excessive edge = tangent point too far

Landing Zone Angle $-32^{\circ} \rightarrow 33^{\circ}$

1-2 mm of tear reservoir is the
desired amount of edge lift

180°

-33°

Landing Zone Angle $-33^\circ \rightarrow -34^\circ$

Landing Zone Angle (Too Steep)

Tangent point too close

Problems with lens adhering to eye
with overnight wear

CRT Dual Axis

+ Proximity Control Technology – CRT is the ONLY lens able to change lens parameters independently of each other

+ Allows for independent manipulation of a second RZD and LZA (if needed) to mimic elevation difference

- RZD1 (500um) and RZD2 (550um)
- LZA1 (32°) and LZA2 (33°)

+ Base curve remains the same

Questions?

0.475	48
0.500	50
0.525	53
0.550	55
0.575	58
0.600	60
0.625	63
0.650	65
0.675	68

RZD Example:
BC = 7.90
RZD = .525
LZA = .33

155 333

MRS

MRS

Flat K Values- 39.00 to 41.62

- Slide tab until arrow points to correct FLAT K.
- Find MRS (Manifest Refraction Sphere - *not* spherical equivalent) to the right of the window.
- The initial diagnostic lens # and parameters appear in the window immediately next to the MRS.

Yellow indicates lenses in the 100-lens Diagnostic Dispensing System.

Pink indicates lenses in the Extended Diagnostic Dispensing System.

White indicates a custom lens.

NOTE: Calculations include Vertex Power Adjustment.

Initial Lens Selection – Numbered Ruler

92. 88-525-33	-3.50
96. 88-550-33	-3.75
109. 89-550-33	-4.00
109. 89-550-33	-4.25
118. 90-550-33	-4.50
118. 90-550-33	-4.75
127. 91-550-33	-5.00
127. 91-550-33	-5.25

MRS

2) Manifest refraction sphere

3) Initial diagnostic lens parameters appear in the window to the left

Lens #96

Parameters: 88-550-33

BC = 8.8mm

RZD = 550um

LZA = 33 degrees

Initial Lens Selector (Electronic Version)

Initial Lens Selector

	Flat K	Steep K	MR Sphere	CRT	lens #
OD	42.00	42.50	3.25	88-525-32	91
OS	42.50	44.00	4.00	89-575-625-33	#N/A

Note: ↑

Do not insert a minus symbol (-) for Manifest Refraction Sphere.
All calculations include Vertex Power Adjustment

Customization of Lens

G indicates
green tint

Tint: Green,
Blue, Red,
Yellow, Clear

Lens Identification

ALL lenses are laser
marked in the RZD to
identify exact parameters

BC= 7.9
RZD = 525 (53), 575 (58), 625 (63)
LZA = 33

It's as Easy as 1,2,3

1 - Determine Initial Diagnostic Lens

2 – Centration

Appropriate Treatment Zone (3-4mm)

Moderate tear-film touch in the mid-periphery

Adjust Edge Lift, if necessary

Be aware of lid interaction

3 – Check Refraction over lens
(ROL) to determine BC/myopia
treatment → +0.50

Centration is the key to success

Ordering Paragon CRT Lenses

Empirical Lens Order

Flat K/Steep K (for CRT Dual Axis)
Manifest Refraction

Standard Power: +0.50,
Can Customize Power

- (-2.00 to +2.00)

Corneal Diameter Size, 10.5mm
>12.0mm, order 11.0mm, 11.5mm

Material: Paragon HDS 100,
Menicon Z
Tint: Green, Blue, Red, Yellow

Diagnostic Dispensing System

100/136 CRT Lenses

16/80 CRT Dual Axis

- 10/14 different Base Curves
- Combination of RZD & LZA

Power: +0.50

Diameter: 10.5mm

Material: Paragon HDS 100
Tint: Green

Questions?

**PARAGON**
VISION SCIENCES

Missing Lenses in DDS

What if the suggested lens is not the DDS set?

- The lens you need has been previously dispensed = 8.6 550 -33
- **Fit 0.10mm Flatter in Base Curve = 8.7 550 -33**
- BC is the least important parameter for evaluating centration.
- RZD/LZA combination is the most important for centering and tear pattern evaluation.
- ROL will determine which BC is necessary (+0.50D)

Subjective Over-Refration (OR)

A subjective refraction over the lens (ROL) determines:

- Accuracy of the treatment Base Curve calculation
- Check residual astigmatism (lenticular cylinder)!!

For best distance vision for children and young adults, ROL should be +0.50 to +1.00

Adjusting BC from Refraction OVER Lens

GP laws

- 0.50D change = 0.1mm
- Steeper ADD Minus, Flatter ADD Plus
- Cylinder present in the ROL will remain untreated as with any spherical gas permeable lens design

Plus Power (+) ROL = Steepen BC to Adjust

Example, BC 8.8, ROL = +1.50 sphere

Want ROL = +0.50 (add -1.00 MINUS/0.2mm) , change BC 8.8 → 8.6

Minus Power (-) ROL = Flatten BC to Adjust

Example, BC 9.0, ROL = -1.00 sphere

Want ROL = +0.50 (add +1.50 PLUS/0.3mm) , change BC 9.0 → 9.3

Initial Lens Dispense Overview

- Schedule appointment for following morning (AM) after sleeping in lenses
- Patient returns **with their lenses in eye**

Refraction OVER Lens (ROL)

- Still +0.50 to +1.00?
- Residual cyl? (unable to correct if through lens)

Centration (& Edge Lift)

- Is the lens moving?
- Instill NaFl to observe pattern (Use wratten filter)

Remove Lens

- Visual Acuity? Check Refraction
- Slit Lamp Examination – any staining? edema?

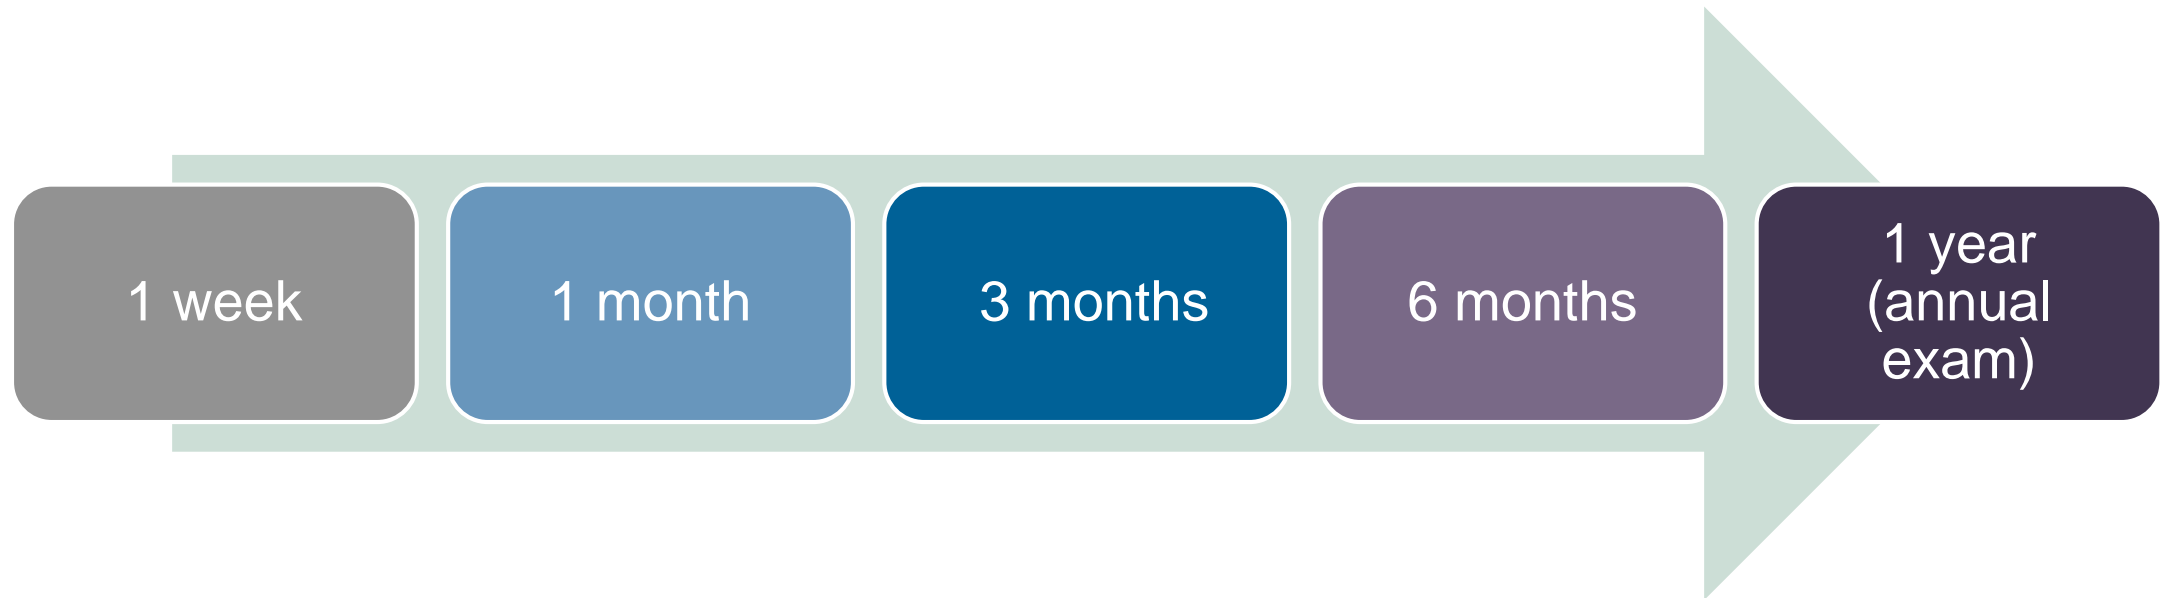

Topography

- Day 1 – Baseline
- Any lens decentration?

The rate of treatment is not predictable

- Average treatment the first night = 2.00 D
- 7-14 days is the average treatment/transition period
 - Lower myopes – within a few days
 - Higher myopes – up to a week
- Vision will regress some during the first day until “corneal mold” is set
- Manage options for VA - temporary soft daily disposable lenses through the day
 - If BC is correct, vision through CRT will be habitual VA

Recommended Follow Up

Have patient always return with lenses to check:

- optimal treatment
- ensure the lenses are clean
- patient is following the proper cleaning and disinfecting procedures

Optimal Fitting Guide Overview

Lens decentered
SUPERIOR

Increase RZD
by 25um

525 → 550

Lens decentered
INFERIOR

Flatten/
Decrease LZA
by 1

33 → 32

Lens decentered
LATERAL

Increase
diameter size
(adjust LZA
accordingly)

10.5mm →
11mm

Treatment Zone
TOO SMALL

Decrease RZD

525 → 500

NaFI bleeding
(6 o'clock)

Use 2 RZD

CRT Dual Axis
525 → 525/575

Optimal Fitting Guide Overview

Lens Edge
THIN

Flatten/Reduce
LZA

33 → 32

Lens Edge
THICK

Steepen/
Increase LZA

33 → 34

Refraction
OVER Lens not
+0.50/+1.00

MINUS (-) ROL,
flatten BC

PLUS (+) ROL,
steepen BC

Refraction
without lens
other than plano

Check
Topography –
Incomplete Mid-
Peripheral Ring?

Use CRT Dual
Axis
525 → 525/575

Questions?

**PARAGON**
VISION SCIENCES

Don't Make Changes Too Quickly

- Lens centration!
- Parameter adjustments to improve lens centration should be done during the one-day follow up.
- Wait to adjust for under-treatment until 1-week follow up visit
 - Lenses centered
 - ROL +0.50 to +1.00

Making First Follow Up Changes

- Decentration – verified by topography
- Unacceptable VA with lenses
 - Lens power/Base Curve
 - Surface/wetting issues
- Discomfort/Slit Lamp Findings
 - Excessive/inadequate edge lift
 - Abnormal staining, edema, etc.
 - Lens adhesion

Make appropriate parameter changes and dispense appropriate diagnostic lens for follow up evaluation

When Not to Make Changes

Do Not Make Changes When:

- Treatment zones are centered
- ROL is acceptable (no minus)
- SLE is unremarkable
- Patient is content & happy
- Under-treatment is apparent at day 1

Proceed to next scheduled appointment with no changes. Order final lenses with warranty.

Great First Few Patients

Ideal Initial 5 patients should be:

- Children progressing in myopia
- Current soft contact lens wearers that complain of dryness or discomfort.
- Spectacle wearers (often contact lens drop-outs).
- In the low to moderate myopia range

- $< -4.00D$
- Flat K's:
42.00D to
45.00D

Proceed with Caution

- Current GP or Ortho-K wearers
- Over 1.50 D of ATR Astigmatism
- Cylinder is Greater than Sphere
Example: -0.75 -1.75 X180

Final treatment takes Cornea Curves below 38.00D

Example:

- Flat K= 41.00
- MRS = -4.00D
- Target treatment= 37.00 Flat K

Higher myopes (>4.00 D) require centration first, treatment second

- Always sacrifice initial applanation for centration
- Choose an RZD that is 25 microns higher/deeper than the suggested RZD to ensure proper centering for the initial overnight wear. Find the lens number suggested from the slide ruler and select the lens vial in the same BC row to select the deeper RZD.

After moderate treatment (7-14 days), subsequent lenses with reduced sagittal depth (RZD and/or LZA) will center and provide full treatment

3 Quick Steps to fitting CRT/CRT Dual Axis

1) Total Diameter: HVID – 1mm

- >11.8mm, customize with 11.0mm diameter lens
- Steepen LZA to keep edge lift relationship the same

2) Corneal toricity > 0.75D → CRT Dual Axis

- Especially limbal to limbal astigmatism

3) Jessen factor set at +0.50 for all lenses

- faster treatment , especially for children = flatten BC an additional 0.1mm for a total ROL:+1.00D

Questions?

**PARAGON**
VISION SCIENCES

- 1) What is the approximate thickness of the corneal epithelium?
- a. 130 microns b. 50 microns c. 80 microns

2) What is the fixed optic zone diameter of the Base Curve?

a. 5.0mm

b. 7.0mm

c. 6.0mm

3) Which parameter is never adjusted to change the fit or centration of a lens?

a. 17A

b. DC

c. D7D

Certification Test

4) What is the target refraction over the CRT lens? (ROL)

- a. -0.50 b. +0.50 c. +2.00**

5) If the refraction over the lens (ROL) is -1.00D, what adjustment should be made in the Base Curve to achieve a +0.50D ROL?

**a. Steepen 0.3mm
0.3mm**

b. Flatten 0.1mm

c. Flatten

6) Which of the following would indicate the lens with the greatest sagittal depth?

a. 8.5 / 550 / -33

b. 8.6 / 550 / -32

c. 8.6 / 575 / -33

7) Of the following, which is the best option to improve centration of a superiorly positioned lens?

- a. Increase RZD b. Decrease RZD c. Steepen BC**

8) Of the following, which is the best option to improve centration of an inferiorly positioned lens?

- a. Increase LZA b. Decrease LZA c. Flatten BC**

9) Return Zone Depths are available in micron increments of:

- a. 15 microns b. 7 microns c. 25 microns**

10) A one-degree change in LZA affects overall sagittal depth by

a. 15 microns

b. 25 microns

c. 7 microns

**11) At dispensing, there is an excessive amount of edge lift.
What adjustment is needed?**

- a. Increase the BC (8.8 → 8.9)**
- b. Decrease LZA (32 → 31)**
- c. Increase LZA (32 → 33)**

**12) At dispensing, there is an insufficient amount of edge lift.
What adjustment is needed?**

- a. Decrease LZA (33 → 32)**
- b. Increase LZA (33 → 34)**
- c. Change RZD (525 → 550)**

Insert photo of very thing edge lift

13) What is the age restriction for wearing the Paragon CRT® Contact Lens?

- a. No age restriction**
- b. Must be over 18**
- c. Must be over 21**

14) How long is the average treatment period for a new Paragon CRT® Contact Lens wearer?

a. 7 to 14 days

b. 1 Month

c. 2 Months

15) When using the Lens Selector Slide Rule, what two components are absolutely needed to determine the correct lens?

- a. Steep K / Manifest Refraction Sphere**
- b. Steep K / Spherical Equivalent**
- c. Flat K / Manifest Refraction Sphere**

16) What patient would be considered a proper candidate based on the FDA approval?

- a. Up to -8.00D myopia, with or without up to -2.50D astigmatism**
- b. Up to -5.00D myopia, with or without up to -2.25D astigmatism**
- c. Up to -6.00D myopia, with or without up to -1.75D astigmatism**

17) When should CRT Dual Axis be considered?

- a. Patient's who display corneal elevation differences**
- b. Patient's who display corneal astigmatism**
- c. Patient's who display incomplete treatment on topography**
- d. All of the above**

18) Which of the following statements is true?

CRT Dual Axis enables you to choose:

- a. 2 BC or 2 RZDs to align the cornea displaying corneal astigmatism**
- b. 2 LZAs to align the cornea displaying differences in corneal elevation**
- c. 2 RZDs or 2 LZAs to align eyes displaying differences in corneal elevation**
- d. 2 BC to align the cornea displaying refractive astigmatism**

19) A patient presents to your clinic to be with fit with OrthoK.

- **The right eye's subjective refraction of -3.25DS**
- **Flat/Steep K 44.00/45.00**
- **Corneal diameter size 11.5mm**

What would be the best initial lens selection for this patient?

- a) 84/550/600/33**
- b) 84/550/33**
- c) 84/575/33**
- d) 84/550/32/34**

**Thank You For Participating in Paragon CRT Contact Lens
Certification & Training Presentation**
